

ASSIGNMENT-16.4

Name: D.Charmi

Ht.no:2303A51314

Batch:05

Task 1: Database Schema Design for an Online Course Platform Scenario

You are designing the backend database for an online learning platform

that manages instructors, courses, and enrolled students.

Task Description

- Use AI tools to generate SQL CREATE TABLE statements for the following entities:
 - o Instructors
 - o Courses
 - o Students
- Include:
 - o Primary keys
 - o Foreign key relationships
 - o Appropriate data types
- Ensure the schema follows basic normalization principles

Prompt:

Generate SQL CREATE TABLE statements for an online course platform.
Tables: Instructors, Courses, Students.
Include primary keys, foreign keys, and proper data types.
Ensure normalization.

Code:

The screenshot shows the VS Code interface with the 'schema.sql' file open. The code defines three tables: Courses, Enrollments, and Instructors. The Courses table has a primary key on course_id and a foreign key to Instructors. The Enrollments table has a primary key on enrollment_id and foreign keys to Students and Courses. The Instructors table has a primary key on instructor_id. The Enrollments table is marked as a Many-to-Many relationship. The SQL Explorer on the right shows the generated SQL statements for each table.

```
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22   course_id INTEGER PRIMARY KEY AUTOINCREMENT,
23   title TEXT NOT NULL,
24   description TEXT,
25   instructor_id INTEGER,
26   FOREIGN KEY (instructor_id) REFERENCES Instructors(instructor_id)
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31   enrollment_id INTEGER PRIMARY KEY AUTOINCREMENT,
32   student_id INTEGER,
33   course_id INTEGER,
34   FOREIGN KEY (student_id) REFERENCES Students(student_id),
35   FOREIGN KEY (course_id) REFERENCES Courses(course_id),
36   UNIQUE(student_id, course_id)
37 );
```

The screenshot shows the VS Code interface with the 'schema.sql' file open. The code defines four tables: Instructors, Students, Courses, and Enrollments. The Instructors table has a primary key on instructor_id. The Students table has a primary key on student_id. The Courses table has a primary key on course_id and a foreign key to Instructors. The Enrollments table has a primary key on enrollment_id and foreign keys to Students and Courses. The Enrollments table is marked as a Many-to-Many relationship. The SQL Explorer on the right shows the generated SQL statements for each table.

```
1 -- Enable foreign key support (IMPORTANT in SQLite)
2 PRAGMA foreign_keys = ON;
3
4 -- Instructors Table
5 CREATE TABLE IF NOT EXISTS Instructors (
6   instructor_id INTEGER PRIMARY KEY AUTOINCREMENT,
7   name TEXT NOT NULL,
8   email TEXT UNIQUE NOT NULL,
9   expertise TEXT
10 );
11
12 -- Students Table
13 CREATE TABLE IF NOT EXISTS Students (
14   student_id INTEGER PRIMARY KEY AUTOINCREMENT,
15   name TEXT NOT NULL,
16   email TEXT UNIQUE NOT NULL,
17   age INTEGER
18 );
19
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22   course_id INTEGER PRIMARY KEY AUTOINCREMENT,
23   title TEXT NOT NULL,
24   description TEXT,
25   instructor_id INTEGER,
26   FOREIGN KEY (instructor_id) REFERENCES Instructors(instructor_id)
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31   enrollment_id INTEGER PRIMARY KEY AUTOINCREMENT,
32   student_id INTEGER,
33   course_id INTEGER,
34   FOREIGN KEY (student_id) REFERENCES Students(student_id),
35   FOREIGN KEY (course_id) REFERENCES Courses(course_id),
36   UNIQUE(student_id, course_id)
37 );
```

Explanation:

- The schema uses separate tables (Instructors, Students, Courses) to avoid data redundancy.
- A many-to-many relationship between students and courses is managed using the Enrollments table.
- Primary keys uniquely identify each record, and foreign keys maintain relationships between tables.
- The design follows normalization principles, ensuring data consistency and integrity.

Task 2: Populate the Database with Sample Records

Scenario

To test the system, the platform needs initial sample data.

Task Description

- Use AI assistance to generate INSERT statements that add:
 - o At least 3 instructors
 - o At least 4 courses
 - o At least 3 students
- Verify correctness using SELECT queries.

Prompt:

```
Generate SQL INSERT statements for:  
3 instructors, 4 courses, 3 students.  
|
```

Code:

This screenshot shows the VS Code editor with a project named 'SQLite'. The Explorer sidebar on the left lists files: 'NEW FOLDER', 'database.db', 'insert.sql', 'query.sql', 'schema.sql', and 'verify.sql'. The 'schema.sql' file is open in the main editor, displaying SQL code for creating tables and inserting data. The code includes a PRAGMA statement to enable foreign keys, followed by CREATE TABLE statements for Instructors, Students, Courses, and Enrollments, each with their respective columns and constraints. The query.sql file is also open, showing INSERT statements for each table.

```
1 -- Enable foreign key support (IMPORTANT in SQLite)
2 PRAGMA foreign_keys = ON;
3
4 -- Instructors Table
5 CREATE TABLE IF NOT EXISTS Instructors (
6     instructor_id INTEGER PRIMARY KEY AUTOINCREMENT,
7     name TEXT NOT NULL,
8     email TEXT UNIQUE NOT NULL,
9     expertise TEXT
10 );
11
12 -- Students Table
13 CREATE TABLE IF NOT EXISTS Students (
14     student_id INTEGER PRIMARY KEY AUTOINCREMENT,
15     name TEXT NOT NULL,
16     email TEXT UNIQUE NOT NULL,
17     age INTEGER
18 );
19
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22     course_id INTEGER PRIMARY KEY AUTOINCREMENT,
23     title TEXT NOT NULL,
24     description TEXT,
25     instructor_id INTEGER,
26     FOREIGN KEY (instructor_id) REFERENCES Instructors(instructor_id)
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31     enrollment_id INTEGER PRIMARY KEY AUTOINCREMENT,
32     student_id INTEGER,
33     course_id INTEGER,
34     FOREIGN KEY (student_id) REFERENCES Students(student_id),
35     FOREIGN KEY (course_id) REFERENCES Courses(course_id),
36     UNIQUE(student_id, course_id)
```

```
1 -- Instructors
2 INSERT INTO Instructors (name, email, expertise) VALUES
3 ('Amina Patel', 'amina.patel@example.com', 'Data Science'),
4 ('Diego Martinez', 'diego.martinez@example.com', 'Web Development'),
5 ('Lina Chen', 'lina.chen@example.com', 'UI/UX Design');
6
7 -- Students
8 INSERT INTO Students (name, email, age) VALUES
9 ('Noah Kim', 'noah.kim@example.com', 20),
10 ('Priya Rao', 'priya.rao@example.com', 21),
11 ('Marcus Taylor', 'marcus.taylor@example.com', 22);
12
13 -- Courses
14 INSERT INTO Courses (title, description, instructor_id) VALUES
15 ('Python Basics', 'Intro to Python', 1),
16 ('Machine Learning', 'ML concepts', 1),
17 ('React Development', 'Frontend with React', 2),
18 ('UI/UX Design', 'Design principles', 3);
```

This screenshot shows the VS Code editor with the same project. The 'schema.sql' file is still open, showing the same SQL code as the previous screenshot. The 'insert.sql' file is now open in the main editor, displaying INSERT statements for each table. The code includes a comment to avoid duplicate email errors, followed by INSERT OR IGNORE statements for each table.

```
1 -- Instructors (avoid duplicate email error)
2 INSERT OR IGNORE INTO Instructors (name, email, expertise) VALUES
3 ('Amina Patel', 'amina.patel@example.com', 'Data Science'),
4 ('Diego Martinez', 'diego.martinez@example.com', 'Web Development'),
5 ('Lina Chen', 'lina.chen@example.com', 'UI/UX Design');
6
7 -- Students
8 INSERT OR IGNORE INTO Students (name, email) VALUES
9 ('Noah Kim', 'noah.kim@example.com'),
10 ('Priya Rao', 'priya.rao@example.com'),
11 ('Marcus Taylor', 'marcus.taylor@example.com');
12
13 -- Courses
14 INSERT OR IGNORE INTO Courses (title, description, instructor_id) VALUES
15 ('Python Basics', 'Intro to Python', 1),
16 ('Machine Learning', 'ML concepts', 1),
17 ('React Development', 'Frontend with React', 2),
18 ('UI/UX Design', 'Design principles', 3);
```

The screenshot shows a VS Code editor with a file explorer on the left containing files: database.db, insert.sql, query.sql, schema.sql, and verify.sql. The main editor has two tabs: 'schema.sql' and 'query.sql'. The 'schema.sql' file contains the following SQL code:

```
1 -- Enable foreign key support (IMPORTANT in SQLite)
2 PRAGMA foreign_keys = ON;
3
4 -- Instructors Table
5 CREATE TABLE IF NOT EXISTS Instructors (
6   instructor_id INTEGER PRIMARY KEY AUTOINCREMENT,
7   name TEXT NOT NULL,
8   email TEXT UNIQUE NOT NULL,
9   expertise TEXT
10 );
11
12 -- Students Table
13 CREATE TABLE IF NOT EXISTS Students (
14   student_id INTEGER PRIMARY KEY AUTOINCREMENT,
15   name TEXT NOT NULL,
16   email TEXT UNIQUE NOT NULL,
17   age INTEGER
18 );
19
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22   course_id INTEGER PRIMARY KEY AUTOINCREMENT,
23   title TEXT NOT NULL,
24   description TEXT,
25   instructor_id INTEGER,
26   FOREIGN KEY (instructor_id) REFERENCES Instructors(instructor_id)
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31   enrollment_id INTEGER PRIMARY KEY AUTOINCREMENT,
32   student_id INTEGER,
33   course_id INTEGER,
34   FOREIGN KEY (student_id) REFERENCES Students(student_id),
35   FOREIGN KEY (course_id) REFERENCES Courses(course_id),
36   UNIQUE(student_id, course_id)
```

The 'query.sql' file contains the following SQL code:

```
1 -- Instructors
2 INSERT INTO Instructors (name, email, expertise) VALUES
3 ('Amina Patel', 'amina.patel@example.com', 'Data Science'),
4 ('Diego Martinez', 'diego.martinez@example.com', 'Web Development'),
5 ('Lina Chen', 'lina.chen@example.com', 'UI/UX Design');
6
7 -- Students
8 INSERT INTO Students (name, email, age) VALUES
9 ('Noah Kim', 'noah.kim@example.com', 20),
10 ('Priya Rao', 'priya.rao@example.com', 21),
11 ('Marcus Taylor', 'marcus.taylor@example.com', 22);
12
13 -- Courses
14 INSERT INTO Courses (title, description, instructor_id) VALUES
15 ('Python Basics', 'Intro to Python', 1),
16 ('Machine Learning', 'ML concepts', 1),
17 ('React Development', 'Frontend with React', 2),
18 ('UI/UX Design', 'Design principles', 3);
```

The screenshot shows the same VS Code editor with the 'verify.sql' file selected. The main editor displays the same SQL schema as the previous screenshot. A query result window is open on the right, showing the results of the query 'SELECT * FROM Instructors;'. The results are displayed in a table with 4 columns: instructor_id, name, email, and expertise. The table contains 3 rows of data.

instructor_id	name	email	expertise
4	Amina Patel	amina.patel@example.com	Data Science
5	Diego Martinez	diego.martinez@example.com	Web Development
6	Lina Chen	lina.chen@example.com	UI/UX Design

Explanation:

- Created sample records using SQL INSERT statements for Instructors, Students, and Courses.
- Used INSERT OR IGNORE to avoid duplicate entry errors due to UNIQUE constraints.
- Verified data insertion using SELECT * queries on each table.

- Checked relationships between tables using JOIN queries to ensure correctness.

Task 3: Implement Core Database Operations (CRUD)

Scenario

The platform administrator needs to manage course and student information.

Task Description

Using AI-generated SQL, perform the following operations:

- Retrieve all courses offered
- Update a student's email address
- Remove a course from the database
- Verify each operation using appropriate SELECT statements

Prompt:

```
Generate SQL queries for:  
- Retrieve all courses  
- Update student email  
| Delete a course
```

Code:

- Retrieve all courses offered

The screenshot shows the VS Code interface with a SQLite database project. The Explorer sidebar on the left shows a folder named 'NEW FOLDER' containing files: 'database.db', 'insert.sql', 'query.sql', 'schema.sql', and 'verify.sql'. The 'verify.sql' file is selected. The main editor displays the 'verify.sql' file with the following SQL code:

```
1 -- Enable foreign key support (IMPC
2 PRAGMA foreign_keys = ON;
3
4 -- Instructors Table
5 CREATE TABLE IF NOT EXISTS Instructors (
6     instructor_id INTEGER PRIMARY KEY,
7     name TEXT NOT NULL,
8     email TEXT UNIQUE NOT NULL,
9     expertise TEXT
10 );
11
12 -- Students Table
13 CREATE TABLE IF NOT EXISTS Students (
14     student_id INTEGER PRIMARY KEY,
15     name TEXT NOT NULL,
16     email TEXT UNIQUE NOT NULL,
17     age INTEGER
18 );
19
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22     course_id INTEGER PRIMARY KEY,
23     title TEXT NOT NULL,
24     description TEXT,
25     instructor_id INTEGER,
26     FOREIGN KEY (instructor_id) REFERENCES Instructors (instructor_id)
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31     enrollment_id INTEGER PRIMARY KEY,
32     student_id INTEGER,
33     course_id INTEGER,
34     FOREIGN KEY (student_id) REFERENCES Students (student_id),
35     FOREIGN KEY (course_id) REFERENCES Courses (course_id),
36     UNIQUE(student_id, course_id)
```

The bottom status bar indicates 'Ln 1, Col 23', 'Spaces: 4', 'UTF-8', 'CRLF', and 'SQLite'. A chat icon on the right shows 'Chat quota reached'.

The screenshot shows the same VS Code interface as the previous one, but with the 'query.sql' file selected. The main editor displays the 'query.sql' file with the following SQL code:

```
1 SELECT * FROM Courses;
```

The bottom status bar indicates 'Ln 1, Col 23', 'Spaces: 4', 'UTF-8', 'CRLF', and 'SQLite'. A chat icon on the right shows 'Chat quota reached'.

Below the SQL editor, the 'SQL' tab is active, showing the query result. The result is a table with 16 rows and 4 columns: 'course_id', 'title', 'description', and 'instructor_id'.

course_id	title	description	instructor_id
1	Python Basics	Intro to Python	1
2	Machine Learning	ML concepts	1
3	React Development	Frontend with React	2
4	UI/UX Design	Design principles	3
5	Python Basics	Intro to Python	1
6	Machine Learning	ML concepts	1
7	React Development	Frontend with React	2
8	UI/UX Design	Design principles	3
9	Python Basics	Intro to Python	1
10	Machine Learning	ML concepts	1
11	React Development	Frontend with React	2
12	UI/UX Design	Design principles	3
13	Python Basics	Intro to Python	1
14	Machine Learning	ML concepts	1
15	React Development	Frontend with React	2
16	UI/UX Design	Design principles	3

- Update a student's email address

This screenshot shows the Visual Studio Code interface with a database schema file named `schema.sql` and a query file named `crud.sql`. The `schema.sql` file contains SQL code to create four tables: `Instructors`, `Students`, `Courses`, and `Enrollments`. The `Students` table has columns `student_id` (primary key), `name`, `email` (unique), and `age`. The `crud.sql` file contains an SQL query to update the email of a student with `student_id = 1`.

```
1 -- Enable foreign key support (IMPOR
2 PRAGMA foreign_keys = ON;
3
4 -- Instructors Table
5 CREATE TABLE IF NOT EXISTS Instructors (
6   instructor_id INTEGER PRIMARY KEY,
7   name TEXT NOT NULL,
8   email TEXT UNIQUE NOT NULL,
9   expertise TEXT
10 );
11
12 -- Students Table
13 CREATE TABLE IF NOT EXISTS Students (
14   student_id INTEGER PRIMARY KEY,
15   name TEXT NOT NULL,
16   email TEXT UNIQUE NOT NULL,
17   age INTEGER
18 );
19
20 -- Courses Table
21 CREATE TABLE IF NOT EXISTS Courses (
22   course_id INTEGER PRIMARY KEY,
23   title TEXT NOT NULL,
24   description TEXT,
25   instructor_id INTEGER,
26   FOREIGN KEY (instructor_id) REFERENCE
27 );
28
29 -- Enrollments Table (Many-to-Many)
30 CREATE TABLE IF NOT EXISTS Enrollments (
31   enrollment_id INTEGER PRIMARY KEY,
32   student_id INTEGER,
33   course_id INTEGER,
34   FOREIGN KEY (student_id) REFERENCE
35   FOREIGN KEY (course_id) REFERENCE
36   UNIQUE(student_id, course_id)
```

```
1 UPDATE Students
2 SET email = 'newemail@example.com'
3 WHERE student_id = 1;
```

This screenshot shows the Visual Studio Code interface with the same database schema file `schema.sql` and a new query file named `verify.sql`. The `verify.sql` file contains an SQL query to select all records from the `Students` table where `student_id = 1`, to verify the email update.

```
1 SELECT * FROM Students WHERE student_id = 1;
```

- Remove a course from the database

Explanation:

- Used SQL **SELECT** query to retrieve all courses from the Courses table.
- Performed an **UPDATE** operation to modify a student's email using their student ID.
- Used a **DELETE** query to remove a specific course from the database.
- Verified each operation by running **SELECT queries** to ensure the changes were applied correctly.

Task 4: Reporting Using Aggregate Queries

Scenario

The platform management wants summary reports for decision-making.

Task Description

- Use AI tools to generate SQL queries that:

- o Count the number of students enrolled in each course
- o List courses with more than a specified number of enrollments
- Analyze the query results for correctness.

Prompt:

Generate SQL queries to:

- Count students per course
- List courses with more than 1 enrollment

Code:

The screenshot shows a code editor with a dark theme. On the left, the 'EXPLORER' sidebar shows a file tree with files: crud.sql, database.db, insert.sql (selected), query.sql, schema.sql, and verify.sql. The main editor area has two tabs: 'schema.sql' and 'insert.sql'. The 'schema.sql' tab is active, displaying a SQL query that counts students per course and lists courses with more than one enrollment. The 'insert.sql' tab is also visible, showing an INSERT statement. The status bar at the bottom indicates 'Ln 5, Col 8', 'Spaces: 4', 'UTF-8', 'CRLF', and 'SQLite'.

```
1 -- Count students per course
2 SELECT c.course_id,
3        c.title,
4        COUNT(e.student_id) AS student_count
5 FROM Courses c
6 LEFT JOIN Enrollments e ON c.course_id = e.course_id
7 GROUP BY c.course_id, c.title
8 ORDER BY student_count DESC; -- Courses with more than 1 enrollment
9
10 SELECT c.course_id,
11        c.title,
12        COUNT(e.student_id) AS student_count
13 FROM Courses c
14 JOIN Enrollments e ON c.course_id = e.course_id
15 GROUP BY c.course_id, c.title
16 HAVING COUNT(e.student_id) > 1
17 ORDER BY student_count DESC;
```

```
1 INSERT OR IGNORE INTO Enrollments (student_id, course_id)
2 (1, 1),
3 (1, 2),
4 (2, 1),
5 (2, 3),
6 (3, 1),
7 (3, 4);
```

6 GROUP BY c.course_id;
```

Ln 6, Col 22 Spaces: 4 UTF-8 CRLF SQLite Chat quota reached SQLite: database.db Go Live

Explanation:

- Used COUNT() function to calculate number of students per course.
- Applied GROUP BY to group results by course.
- Used HAVING clause to filter courses based on enrollment count.
- Verified results to ensure accurate aggregation and reporting.

Task 5: Query Optimization with AI Suggestions

Scenario

As the platform grows, query performance becomes critical.

Task Description

- Use AI to analyze an existing query that retrieves courses taught by instructors from a specific country.
- Refactor the query using:

- o Efficient joins
- o Optional indexing suggestions
- Compare results before and after optimization.

Prompt:

Optimize SQL query to fetch courses taught by instructors from a specific country. Use joins and suggest indexing.

Code:

The screenshot shows the VS Code interface with the following files in the Explorer:

- crud.sql
- database.db
- insert.sql
- query.sql
- schema.sql
- verify.sql

The `query.sql` file contains the following SQL code:

```
1
2 UPDATE Instructors SET country = 'India' WHERE instructor_id = 1;
3 UPDATE Instructors SET country = 'USA' WHERE instructor_id = 2;
4 UPDATE Instructors SET country = 'India' WHERE instructor_id = 3;
```

The screenshot shows the VS Code interface with the `verify.sql` file selected. The SQL query results are displayed in a table:

instructor_id	name	email	expertise	country
4	Amina Patel	amina.patel@example.com	Data Science	NULL
5	Diego Martinez	diego.martinez@example.com	Web Development	NULL
6	Lina Chen	lina.chen@example.com	UI/UX Design	NULL

The screenshot shows the VS Code interface with three files open: `schema.sql`, `query.sql`, and `verify.sql`. The `query.sql` file contains the following SQL query:

```
1 SELECT
2   c.title,
3   e.description,
4   i.name AS instructor
5 FROM Courses c
6 INNER JOIN Instructors i
7 ON c.instructor_id = i.instructor_id
8 WHERE i.country = 'India';
```

The screenshot shows the VS Code interface with the `schema.sql` file open. The file contains the following SQL schema:

```
1 -- Count student
2 SELECT c.course
3 c.title,
4 COUNT(e.student
5 FROM Courses c
6 LEFT JOIN Enroll
7 GROUP BY c.cour
8 ORDER BY studen
9 SELECT c.course
10 c.title,
11 COUNT(e.student
12 FROM Courses c
13 JOIN Enrollment:
14 GROUP BY c.cour
15 HAVING COUNT(e:
16 ORDER BY studen
```

Below the schema, a table view is displayed for the `Instructors` table. The table has the following structure:

cid	name	type	notnull	dfilt_value	pk
0	instructor_id	INTEGER	0	NULL	1
1	name	TEXT	1	NULL	0
2	email	TEXT	1	NULL	0
3	expertise	TEXT	0	NULL	0
4	country	TEXT	0	NULL	0

Explanation:

- Identified error due to missing country column in the Instructors table.
- Added the country column using ALTER TABLE and updated values using UPDATE statements.
- Re-ran the query after fixing the schema to retrieve correct results.

- Ensured proper query execution by aligning table structure with query requirements.
