

ASSIGNMENT 14.4

D.Charmi

2303A51314

Batch – 05

TASK – 01

Prompt :

Output :

Explanation :

The website contains three main sections: a header, main content, and footer. The header is placed at the top and includes the startup logo and navigation links such as Home, About, Services, and Contact, allowing users to move between pages easily. The main content section is the central part of the page where a welcome headline and a short description of the startup are displayed, sometimes along with additional information or features. The footer is located at the bottom and provides basic details such as copyright information and contact details. The website is designed to be responsive, meaning it uses CSS media queries so the layout adjusts automatically for desktop, tablet, and mobile screens for better user experience.

TASK – 02

Prompt:

Add a Call-to-Action button (e.g., “Get Started” or “Sign Up”).

Use JavaScript so that when the button is clicked, it displays an alert or message on the page.

Ensure the page does not reload when the button is clicked.

Include clear comments in the JavaScript code explaining what each part does.

Keep the code clean, simple, and beginner-friendly in a single HTML file.

Output :

Explanation :

When the “Get Started” (or “Start for free”) button is clicked, the website triggers a JavaScript action. Instead of reloading the page, the script displays a confirmation message on the screen that says “Welcome aboard! Thanks for signing up. We’ll be in touch soon!”. This message acts as a visual response to the user’s interaction, letting them know that their action was successful. It

improves user experience because the feedback appears instantly without refreshing the page. The functionality is usually implemented using a JavaScript click event listener that shows an alert or dynamically displays a message element when the button is pressed.

TASK – 03

Prompt :

Add a Contact Form to the existing web page with fields for Name, Email, and Message. Use JavaScript client-side validation to prevent empty submissions and check for a valid email format. Display clear inline error messages for invalid inputs and show a success message when the form is submitted correctly, without reloading the page. Include comments in the JavaScript code explaining the validation logic.

Show less

Output :

The top screenshot shows a contact form on a dark-themed website. The form has three input fields: 'Name' (filled with 'Devisetty Charmi'), 'Email' (filled with 'charmidevisetty29@gmail.com'), and 'Message' (filled with 'hi'). Below the message field is a red 'Send Message' button. The top navigation bar includes links for 'Home', 'About', 'Services', 'Contact', and a 'Get Started' button. A message 'get back to you as soon as possible.' is displayed above the form.

The bottom screenshot shows the same form after submission. The 'Send Message' button is still present. A success message 'Message sent! Thanks for reaching out. We'll get back to you soon!' is displayed on the right side of the form, accompanied by a checkmark icon.

Explanation :

The changes made here are related to the Contact Form and its client-side validation.

A “Send Message” button has been added below the message input field so users can submit their queries. When the user fills in the Name, Email, and Message fields and clicks this button, JavaScript validation runs on the client side.

If the inputs are valid, the page shows a success confirmation message on the right side that says “Message sent! Thanks for reaching out. We'll get back to you soon!”. This indicates that the form was submitted successfully.

The important change is that this feedback appears instantly without reloading the page, which means JavaScript is handling the form submission and displaying the message dynamically. If any field were empty or the email format were incorrect, the script would show inline error messages instead of the success message.

TASK – 04

Prompt :

Add a Dynamic Product List section to the web page. Create a simple HTML list to display items along with two buttons: "Add Item" and "Remove Item" Use JavaScript so that clicking Add Item inserts a new item into the list and clicking Remove Item deletes the last item from the list. Ensure the DOM updates instantly without reloading the page, and include clear comments in the JavaScript code explaining the logic.

Just now

Output :

Dynamic Product List

Use the buttons below to add or remove items from the list.

+ Add Item

– Remove Item

1 Wireless Headphones

2 Mechanical Keyboard

3 Product Item 6

4 Product Item 7

4 items in list

Explanation :

This section shows a Dynamic Product List where users can manage items interactively. The page contains two buttons: “Add Item” and “Remove Item”. When the Add Item button is clicked, JavaScript dynamically adds a new product to the list. When the Remove Item button is clicked, the last item in the list is removed. The list updates instantly without refreshing the page, demonstrating DOM manipulation using JavaScript. At the bottom, the page also shows the current number of items in the list.

TASK – 05

Prompt :

Published your app just now

Add a Modal Popup Notification to the existing web page. Create an Open Modal button that displays a popup message. Use HTML for the modal structure, CSS for styling with a semi-transparent background overlay, and JavaScript to open and close the modal. Allow the modal to close by clicking a Close button or clicking outside the modal (overlay). Ensure the popup appears above the page content and closes smoothly without reloading the page, and include clear comments in the JavaScript code.

Just now

Working..

Output :

Explanation :

The update adds a notification modal popup to the page. A blue “Open Notification” button is placed in the button row, and when it is clicked, a full-screen semi-transparent dark overlay appears that dims the background content. On top of this overlay, a modal popup card is displayed containing a title, a message, and a Close button. The popup floats above the page content to grab the user’s attention, and it can be closed either by clicking the Close button or by clicking outside the popup on the overlay.
